

# **Documentation**

## **tSMS – Temporary SMS Receiving System**

By Harshit Peer

# Requirements

## Server Requirements

PHP  $\geq$  7.1.3

OpenSSL PHP Extension

PDO PHP Extension

Mbstring PHP Extension

Tokenizer PHP Extension

XML PHP Extension

Ctype PHP Extension

JSON PHP Extension

BCMath PHP Extension

## Other Requirements

SMS Gateway with ability to forward SMS to API

# Installation

## #1 – Upload Files

You will receive a zip of files after you purchase tSMS from CodeCanyon. Just upload that ZIP file in root directory of your domain. After upload, extract those files. Your folder structure of the root directory will be something like below

Name
 app
 bootstrap
 cgi-bin
 config
 database
 public
 resources
 routes
 storage
 vendor
 artisan
 server.php
 webpack.mix.js

## #2 – Visit the domain URL

Visit your website URL. Installation Wizard will be automatically started once you visit your website. Just follow the on screen instructions. You will need to create MySQL Database, Email account for sending emails and last step will be to create a Admin Account. You will also need to verify your purchase as the very step of the Installation Wizard.

### #2.1 Instructions

#### tSMS Installer

This installer will guide you through various installation process and will need you to create Database & Email account from your control panel. It will ask for various details which you will get from your control panel after creating Database and email account. In case if you are not familiar on how to proceed watch the tutorial video here <https://you.be/1Bs23>

Proceed

Read the instructions and once you are done, click on Proceed.

## #2.2 License Code

Next step is to add your License Code, for this you will need to enter the license code you received from CodeCanyon after purchasing tSMS.

### License Check

License Code

XXXXXXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX

Next

After entering License Code, hit next and proceed to next section

## **#2.3 Website Details**

You will need to enter following details about your Website

Website Name – This will be used in the Title Bar and on your emails which will be sent by the Application.

Website URL – This will also be used in your emails to connect your users with the website.

SMS Gateway API Key – This is an important parameter which will be used for authentication of the SMS Gateway API Call.

Your License Code is Valid. Please proceed further with Website Details

## Website Details

Users

Configuration

Terms Editor

After Terms Editor, goto **Configuration** Page.

On this page, you will be able to make changes to Logo, Social Media URLs, Ad Space Code, etc. You can also change any DB configuration or Mail Configuration change on this page.

## Add your First Number

Finally, it's time to add your very First Number. You can use **Numbers** Page to add a new number or manage already added number.

You will see below form once you visit Numbers Page to add New Number.

### Add New Number

-----

Phone Number	Select Country ▼	Select Type ▼
Submit		

First field is to add Phone Number. Add your phone number which you bought from SMS Gateway with the country code and without any space, plus sign or hyphen. For example, if your purchased phone number is **+1 987 654 3210** then enter **19866543210**

Select Country from the second field and then choose which type you want. If you choose "Registered Only", then only registered users of your website will be able to use that number for receiving SMS online. If you choose "Open" then anyone visiting your website will be able to use that number for receiving SMS online.

## Setup number on SMS Gateway

You will need to setup a API call everytime your phone number receives a SMS. Most of the SMS Gateways offers this. Below are the settings on which you will need to setup the API call.

URL – <https://yourdomain/receive>

Method – GET or POST

Parameters	Details
number	Actual phone number on which message is received.
sender	Sender of the SMS
msg	Actual content of the SMS
msg_id	SMS Message ID
